

PLASTIC STRAWS

LIFE SPAN:

20 to 400 years

FAST FACTS:

Straws are rarely recycled. In the US alone, an average of 500 million straws are used everyday. Out of the 500 million straws, only 5% is recycled. The rest end up in landfills, and worse, in our coasts and oceans, potentially killing marine life.

Straws may seem like they do no harm, but the impact they can have on the environment and animals is huge. It's the small things that count.

THE SOLUTION

SKIP THE STRAW
OR USE A METAL,
GLASS, OR
BAMBOO
STRAW.

MEET THE
PLASTICS
